

ELOFID · WHITEPAPER V5.0

Security that starts before the loss.

Elofid is security infrastructure for Web3. It shows people and the teams that build for them what a token, a contract or a wallet permission can really do, before they sign, buy or connect. Evidence first, verified on-chain, with unknowns always reported as unknown.

A proactive security layer for Web3

Most losses in Web3 are not dramatic hacks. They come from tokens that cannot be sold, taxes hidden in a contract, forgotten wallet approvals and transactions whose real effect was never clear. People usually discover the risk only after the damage is done.

Elofid changes that order. Its tools read the blockchain directly, simulate what would happen before anything is signed, and present the result in plain language. Every figure is either verified on-chain or clearly marked as unverified.

Elofid works on two levels:

- **Tools for people:** the Security Hub (Quick Scan and Deep Intelligence), the Elofid Scanner Bot on Telegram and the Firewall for wallet approvals.
- **Infrastructure for teams:** Continuous Monitoring that turns meaningful changes into Events and Risk Incidents, delivered through the Developer API and signed webhooks.

One engine, every surface. The website, the Telegram bot and the monitoring pipeline all use the same scanning engine and the same reporting rules. A token scored on the website is scored the same way in Telegram and in a webhook.

02 · THE PROBLEM

People are rarely hacked. They are left exposed.

Risk builds up quietly, through details that normal interfaces do not show:

Hidden token behavior

Honeypots that block selling, taxes that can take most of a trade, owners who can mint, pause or blacklist. None of it is visible on a price chart.

Invisible permissions

Token approvals stay active long after a trade. A single compromised spender can drain every token it was allowed to move.

Unclear signatures

Transaction prompts rarely show real intent. People approve calls they cannot read, on networks they cannot verify.

Most scanners answer these questions with a single score. When data is missing, many of them quietly treat it as safe. Elofid is built on the opposite rule: **a result is only as strong as the evidence behind it**, and missing evidence is shown as missing.

03 · THE PRODUCT SUITE

Five products. One security engine.

A. Security Hub LIVE

A multi-chain token and contract scanner at elofid.com/security, covering 12 networks. No wallet connection is needed, and results arrive in seconds, in four languages.

Quick Scan

- Contract controls: owner, mint, pause, blacklist, proxy and upgradeability
- Liquidity, pools, and LP lock and burn evidence
- Holder concentration and market structure
- DEX and centralized exchange listings

Deep Intelligence

- **Real buy and sell simulation** through the token's own DEX router. It detects honeypots and measures buy, sell and transfer tax.
- Deployer history, including earlier tokens scanned by Elofid
- Early buyers, launch activity and shared-funding wallets
- LP lock expiry, ownership history and upgrade history

The Security Hub also includes a **Tx Decoder**, which turns a transaction into a readable preview before it is signed, and an **RPC Health Checker**, which flags unhealthy or suspicious network endpoints.

B. Elofid Scanner Bot LIVE

The same engine inside Telegram, at [@ElofidBot](#). Paste a contract address and receive a structured report with an overall score, contract risks, a live buy and sell simulation, DEX and centralized exchange liquidity, holder analysis and **Exit Path**: how much can realistically be sold through the available pools.

Private chat

Send a contract address, or a sentence that contains one, and get a report in seconds.

Groups

Add the bot to a community group so every member can check a token before buying.

Inline, in any chat

Type @ElofidBot and an address in any conversation to share a live report there.

Every report links to More Details and to the Full Report on the Security Hub. Figures read directly from the chain are marked as verified on-chain.

C. Firewall LIVE

Wallet protection for the approvals a person has already given.

Blast Radius

Maps every active token approval and the value each spender could move. Known protocol spenders are labeled.

Fix Mode

A clear path to revoke dangerous permissions, starting with the highest exposure.

Wallet Watch

Live monitoring that alerts in the browser when a new approval appears on a watched wallet.

Wallet Passport

A cryptographically signed, wallet-bound security record that reflects the wallet's security posture.

Firewall reports can be exported as PDF, CSV or JSON.

D. Continuous Monitoring

A scan shows what an asset looks like now. Monitoring shows what changes. Every monitored token is re-checked on a schedule, and every observation is a full Elofid scan that is archived as evidence.

- **Events** open when a meaningful change is detected, from archived scan evidence only, and follow one lifecycle from open to resolved.
- **Risk Incidents** group related independent signals into one factual incident. Five changes do not become five alerts.
- **Global Intelligence** shows what Elofid detects across the network, beyond a team's own watchlist.

AREA	EVENT TYPES
Liquidity and exit	liquidity_collapse exit_depth_collapse exit_depth_deterioration
Market and score	price_collapse score_deterioration
Trading and tax	honeypot_risk sell_blocked buy_blocked tax_spike tax_changed tax_reduced
Contract control	mint_authority_risk freeze_authority_risk pause_risk proxy_implementation_changed
Ownership	owner_changed owner_renounced owner_restored_after_renounce
Supply	supply_increase supply_decrease
Deployer	deployer_large_sell

Tax events are available for EVM tokens that trade on a V2-compatible pool.

E. Developer API

Programmatic access to Elofid monitoring for wallets, exchanges, trading bots and security teams.

ITEM	DETAILS
Base URL	<code>https://api.elofid.com</code>
Authentication	Authorization: Bearer <code><API_KEY></code> . Every plan, including Free, uses an API key. A workspace keeps one persistent key, and changing plans keeps the same key.
Service status	<code>GET /v1/health</code>
Asset monitoring	<code>GET /v1/monitoring/assets/:chain/:token/events</code> <code>GET /v1/monitoring/assets/:chain/:token/incidents</code>
Feeds	<code>GET /v1/events</code> <code>GET /v1/incidents</code>
Watchlists	<code>/v1/watchlists</code> and <code>/v1/watchlists/:id/assets</code>
Webhooks	<code>GET /v1/webhooks</code> <code>POST /v1/webhooks</code>
Usage	<code>GET /v1/usage</code> , which does not count toward the quota

Signed webhooks

Incident lifecycle webhooks are delivered as `elofid.incident.created` , `elofid.incident.updated` and `elofid.incident.resolved` . Each delivery is signed with HMAC-SHA256. The `Elofid-Signature` header is `v1=<hex>` , an HMAC of `Elofid-Timestamp` , a dot and the raw body, using the endpoint's `whsec_` secret. `Elofid-Delivery-Id` lets a receiver ignore duplicates, and failed deliveries are retried.

Plans

PLAN	API CALLS PER MONTH	HISTORY	INTELLIGENCE
Free	10,000	7 days	Full intelligence on monitored assets, Global Intelligence preview
Starter	50,000	30 days	Full Global Intelligence and Global Feed API
Growth	250,000	60 days	Increased monitoring priority
Pro	1,000,000	90 days	High-capacity infrastructure
Enterprise	Custom	Custom	Custom requirements and asset capacity

Only authenticated customer calls count toward the monthly quota. Dashboard traffic and internal webhook processing do not. When the quota is used up, the API returns `api_call_limit_reached` .

04 · LIQUIDITY AND EXIT PATH

Liquidity tells part of the story. What can actually get out?

Headline liquidity is the value a market provider reports for a pool. It is useful context, but it is not the same as the amount a holder can actually sell. Elofid separates the two.

Headline liquidity

Shown only from returned market data, labeled by source, and cross-checked against on-chain pool balances.

Executable exit

Exact when the scan has complete supported coverage. With partial coverage it is a verified lower bound, shown as "at least".

Never invented

A value that cannot be verified is never shown as a number. The report says why it is missing.

Evidence over claims

Every Elofid product follows the same reporting rules. They are what make a result trustworthy, and what separate a security tool from a score generator.

Unknown is never shown as clean

If a data source fails or coverage is incomplete, the report says so and explains why. A missing value is never displayed as zero, "none" or "safe".

On-chain verification is marked

Figures read directly from the blockchain are labeled as verified. Figures from third-party providers are labeled by source.

Simulations never touch real funds

Buy, sell and transfer tests run as read-only simulations. Nothing is broadcast, nothing is signed and no user funds are involved.

Context, not accusations

Signals such as a fresh deployer wallet or shared funding are presented as evidence to review, with the reasoning shown, not as proof of intent.

Public data in, protected analysis, signed results out

- **In the browser:** scans read public blockchain data. Nobody shares a seed phrase, and scanning never requires a wallet connection.
- **Protected services:** heavier analysis, such as Deep Intelligence, simulations and the API, runs on protected server infrastructure. Provider keys stay on the server and are never shipped to the browser.
- **Monitoring pipeline:** observations are archived, compared over time and turned into Events and Risk Incidents only from trusted evidence. Results leave the system as signed webhooks and authenticated API responses.

12 networks, one report format

EVM		NON-EVM	
BNB Smart Chain	Ethereum	Base	Solana
Arbitrum	Polygon	Optimism	
Avalanche	Linea	Scroll	
opBNB	Robinhood Chain		

From one trader to a whole exchange

Traders and holders

Check a token before buying and clean up risky approvals, for free, on the website or in Telegram.

Communities

Group admins add the Scanner Bot so members can check every token shared in the chat.

Builders

Wallets, exchanges, trading bots and security teams monitor assets and receive signed alerts through the API.

Official channels and anti-scam rules

- Admins will never message you first. Treat every unsolicited direct message as a scam.
- Never share a seed phrase or private key, with anyone, for any reason. No Elofid product will ever ask for one.
- Ignore anyone offering "support fixes", recovery services or private airdrops in Elofid's name.
- Only announcements in the official channels are valid: **elofid.com**, **@elofid_official** on Telegram and **@ElofidNetwork** on X.
- Always verify the domain **elofid.com** before connecting a wallet, and review every transaction before signing.

If anything is unclear, do not connect the wallet and do not sign.

11 · DISCLAIMER

Security tools in a high-risk environment

Elofid provides security information and tools. Nothing in this document is financial, investment, legal or tax advice. Scores, signals and warnings are informational only. They are not an audit and not a guarantee of safety.

- **Analysis limits:** security scans reduce risk but cannot eliminate it. A clean result is not a guarantee of safety.
- **Third-party data:** some figures come from external providers and can be delayed, incomplete or wrong. They are labeled by source.
- **Network risk:** congestion, forks, RPC failures or chain-level issues can affect results and access.
- **Operational risk:** website, provider or infrastructure outages can limit access to tools.
- **Regulatory risk:** laws and their interpretation can change. Users are responsible for complying with the rules that apply to them.

Web3 security should begin before the loss, not after it.
